Introduction to Backup addon

Introduction

The **backup addon** allows you to enable the history of changes made by users and some objects related to them.

What is the backup addon?

Soffid allows you to save snapshots for each user to keep track of changes as they occur.

On the **user** page, you can view these snapshots and also view the history of other items:

- The **groups** you have belonged to,
- The **accounts** you have linked,
- The **roles** you have been assigned,
- And the **mail lists** you have belonged to.

> For further information, please consult the Users page.

On the **User backup configure & restore** page you can perform botch actions.

- To configure the backup, you could manage the frequency and number of user snapshots.
- To restore user data for a specific date, you only need to select the proper record and click the restore button.

> For further information, please consult the User backup configure & restore page.
