
Configure Workflow engine

Description

Soffid can use any document repository to store documents generated by workflows, reporting addon, or any other addon.

The document repository can be either a local directory or a remote one accessed using FTP, SMB, HTTP protocols. Depending on the protocol selected, additional parameters may be needed.

Soffid console maintains a textual index that allows searching for currently active or finished processes using full text search.

The textual index for searches can be updated from this page. The textual index is not stored in the database but filesystem. From this page, you can set the directory where this textual index will be stored.

Because it is stored in non-transactional storage, it can get occasionally corrupted. In such a case, by pressing the RebuildIndex button, the index will be rebuilt from scratch.
