Introduction to BPM addon

Introduction

The **BPM addon** allows Soffid administrators to generate and maintain their own workflows directly from the Soffid Console itself.

What is a workflow?

Soffid has implemented a BPM engine that allows Soffid to manage **workflows**.

Workflows can facilitate, streamline, control, and audit multiple business processes.

There are many **examples** of possible workflows.

- User registration from HR
- Allow users to update certain data
- Request privileged accounts
- Request roles for oneself
- Allow managers to request a large number of permissions
- Confirm that a manual process is executed and attach evidence
- Request company resources
- Perform scheduled user logouts

Many Soffid screens are involved in the BPM module. We list the most important ones below.

- BPM editor : where to create or modify workflows
- Business process definition : where workflows are published
- Configure Workflow engine : where the workflow engine is configured
- My tasks : pending workflows where the user has to perform an action in order to continue their workflow.
- My requests : The workflows that the user can initiate are listed here.
- My requests > Query request status : to search for all processes started by oneself
- Process Search : to search for all processes
- Metadata : to add attributes to display in the search tables

- Scheduled jobs : shows active workflows pending asynchronous tasks
