
5. Document class

Introduction

When an action is associated with a Web application, it creates a document that identifies the full HTML document. This object assigned to the document variable. Thus, scripts can access the web contents and its DOM tree in runtime. The document object implement a subset of the standard DOM HtmlDocument.

Attributes

url	string	Full URL of the document.
domain	string	Contains the domain of the page.
title	string	Title of the document.
cookie	string	Contains cookies that are bound to this document.
anchors	Collection	Contains elements of type A.
forms	Collection	Contains items of type FORM.
images	Collection	Contains items from IMG.
links	Collection	Contains elements of type A and AREA.
documentElement	Item	Contains the root element.

Methods

getElementById	id: string Element returns	Find the first element with the specified ID.
getElementsByTagName	tag: string returns Collection	Find all elements with the specified tag.
write	text: string	Add content to the document.

writeIn	text: string	Add content and new line to the document.
autofill	text: string	Proceed with smart auto fill engine, allowing end user to select and or save accounts. The mandatory parameter sets the domain where to look for accounts.
