
6. Element class

Introduction

The objects of type `Element` are created for each input element with a `ref-as` attribute, or are obtained from the Document itself. It implements a subset of the DOM class `HTMLElement`.

Attributes

<code>childNodes</code>	Collection	Vector of children elements.
<code>disabled</code>	bool	Indicator whether the element is disabled or not.
<code>id</code>	string	Id attribute of the element.
<code>tagName</code>	string	Element's tag.
<code>parentNode</code>	Item	Parent element.

Methods

<code>getAttribute</code>	name: string returns string	Gets the attribute value of the element.
<code>setAttribute</code>	name: string value: string	Updates the attribute value.
<code>removeAttribute</code>	name: string	Removes an attribute.
<code>getElementsByTagName</code>	tag: string returns Collection	Find all children with the specified tag.
<code>click</code>		Acts as if the user had clicked on the button.
<code>blur</code>		Remove focus.
<code>focus</code>		Grants focus.
<code>submit</code>		Send form contents.
