

# ESSO Related configuration parameters

## Introduction

There are some configuration parameters that can be tuned on Soffid console.

| Parameter                | Value  |
|--------------------------|--|
| <b>SSOServer</b>         | Comma separated of synchronization servers the ESSO should connect to  |
| <b>seycon.https.port</b> | TCP/IP synchronization servers are listening to. By default 760  |
| <b>SSOSoffidAgent</b>    | Name of the agent used to authenticate user accounts.<br>If none is specified, the user name entered by the user is matched against usernames.<br>If an agent name is specified, the user name entered by the user is matched against active accounts on this agent. |
| <b>LogonEntry</b>        | Application entry point to execute after login.  |
| <b>OfflineEntry</b>      | Application entry point to execute when the desktop is offline. The script belonging to this application entry point will be stored locally.   |
| <b>AutoSSOSystem</b>     | Virtual agent name where to store user registered accounts   |
| <b>AutoSSOPolicy</b>     | Password policy to apply for user registered accounts  |

As stated at Parameter screen documentation, a single parameter can have a global default value and specific values on a subnetwork basis. This mechanism allows the administrator to setup different synchronization servers for each subnet.
