Step 3.2. Account repositories

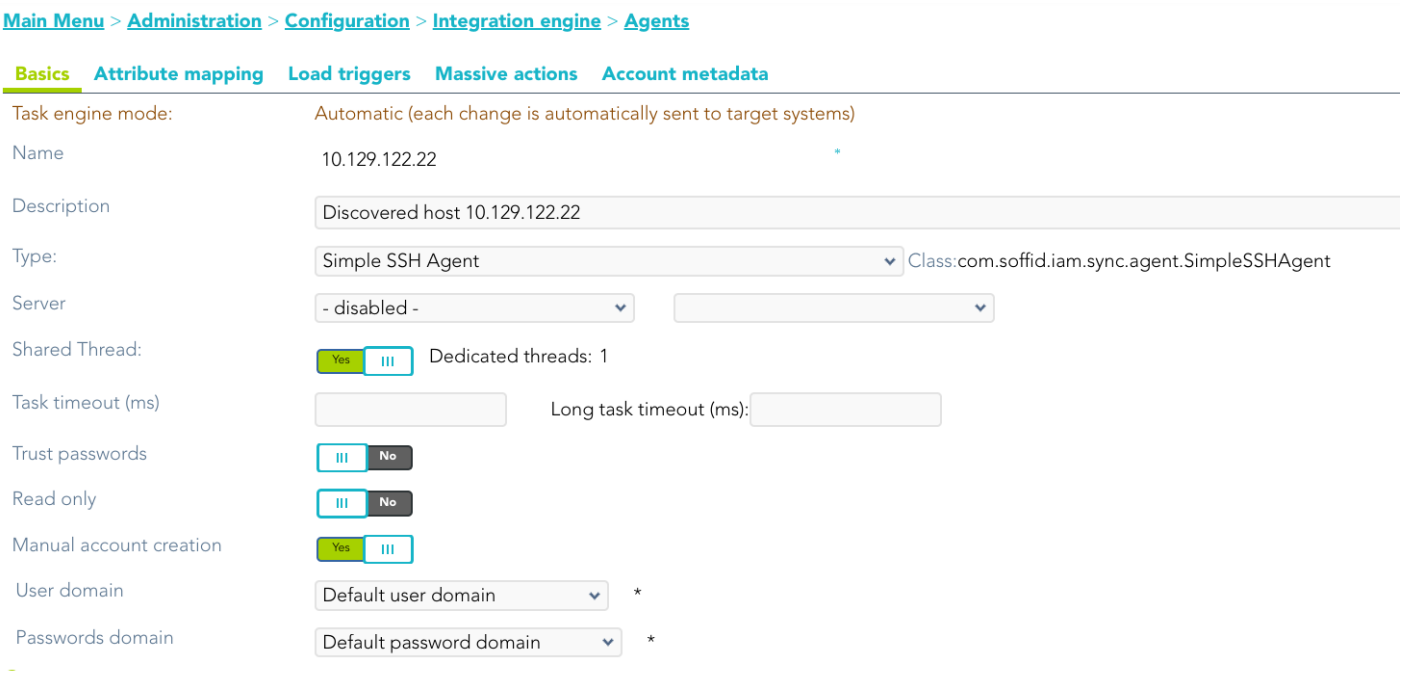

Once the network discovery process is complete, Soffid will have detected the devices connected to that network and will create, where possible, a repository of accounts. Soffid will also attempt to obtain all accounts from this repository.

This is an automatic process, and as a result, you will be able to access the agent definition and the accounts created

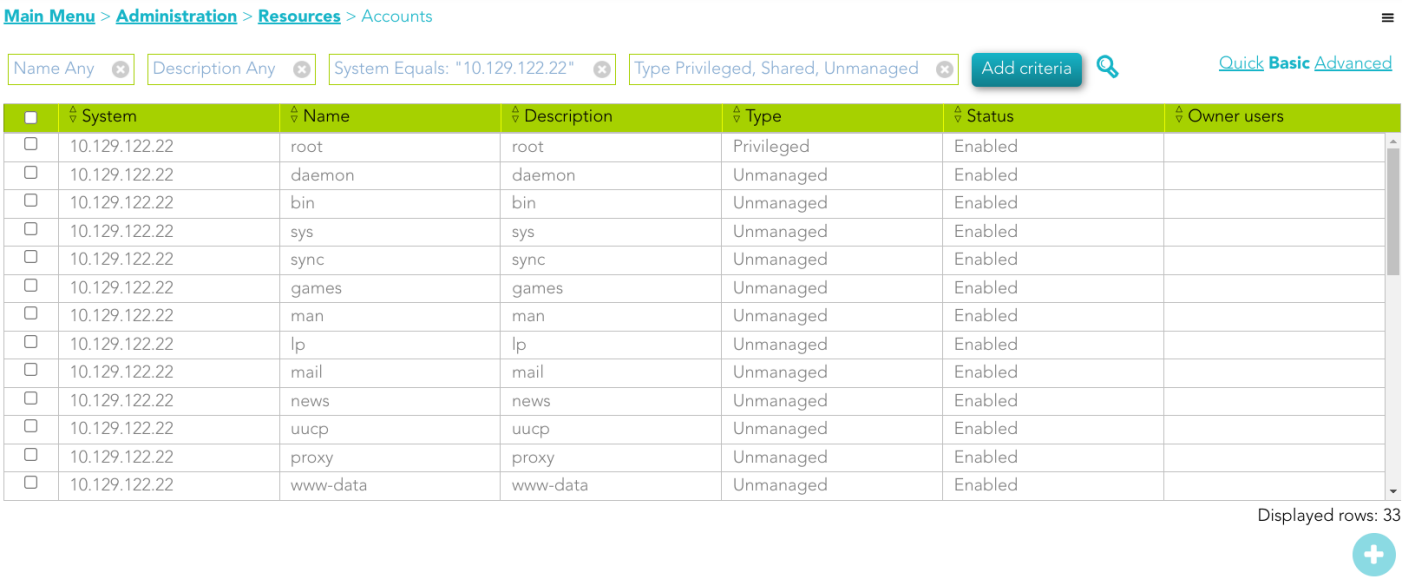

Agent definition

On the agent page, you could find the agent definition.

Accounts

On the accounts page, you could find all the accounts detected at this system.
