2026-06-13 New feature: select images for Soffid Authenticator

The new feature

> The Soffid Authenticator app now has four different **sets of images**, and you can now select the set of images using the "**soffid.push.images**" parameter.

Bear in mind

Please note the following points:

- A **Soffid** type **Identity Provider** must be set up, and the **Soffid Authenticator** (push option) must be added as the **first** or **second factor**.
- Users are required to install the **Soffid Authenticator** on their **phones**.

> The **details of the parameter** can be found on the Soffid parameters page, Soffid Autenticator section..

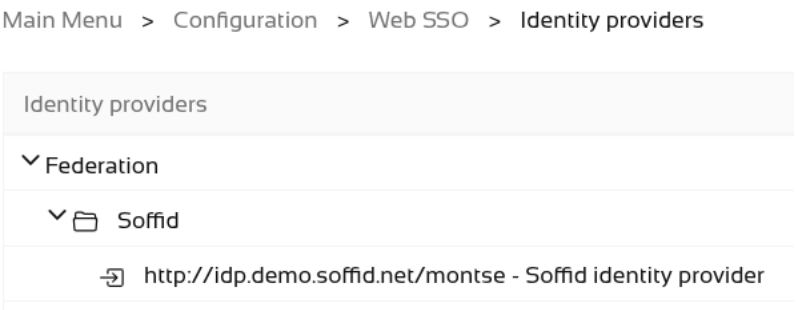

How to configure it?

The following **components** must be installed:

- Addon federation 4.0.36 (or higher)

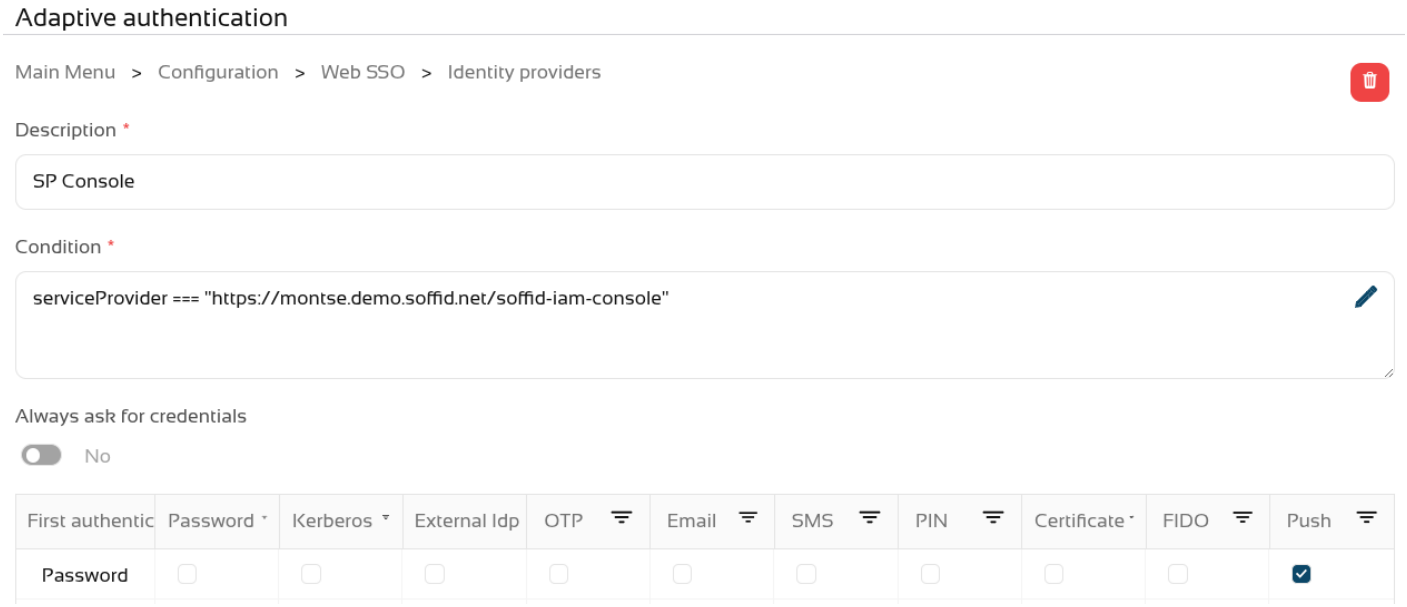

Let's look at an example

Do you need a Soffid IdP.

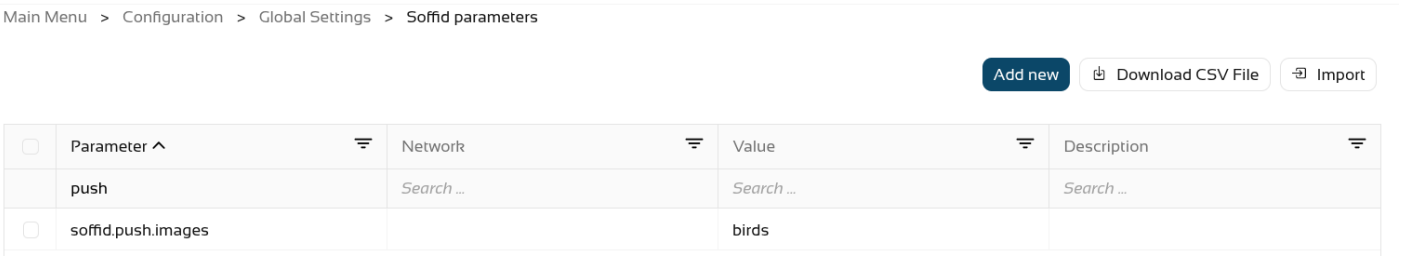

Add Soffid Authenticator as a first or second factor.

- Go to **Soffid IdP**.
- Go to **Default authentication methods** or **Adaptive authentication** (used this option in the example)
- Add the Soffid Authenticator (**Push** option) as **first** or **second factor** used this option in the example)

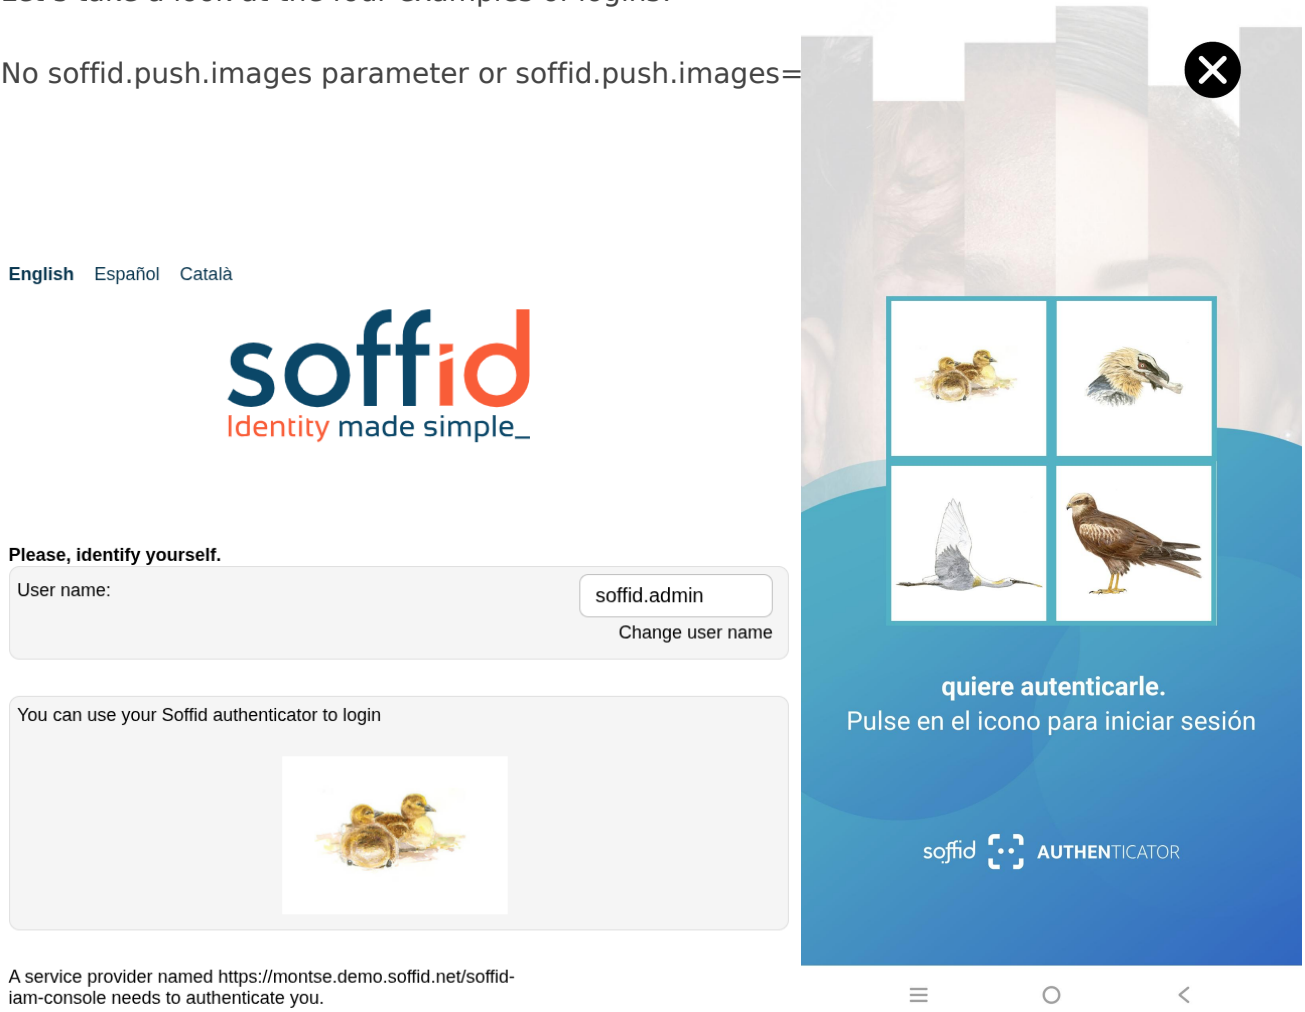

We can now use the **parameter** "**soffid.push.images**" to view the different sets of images.

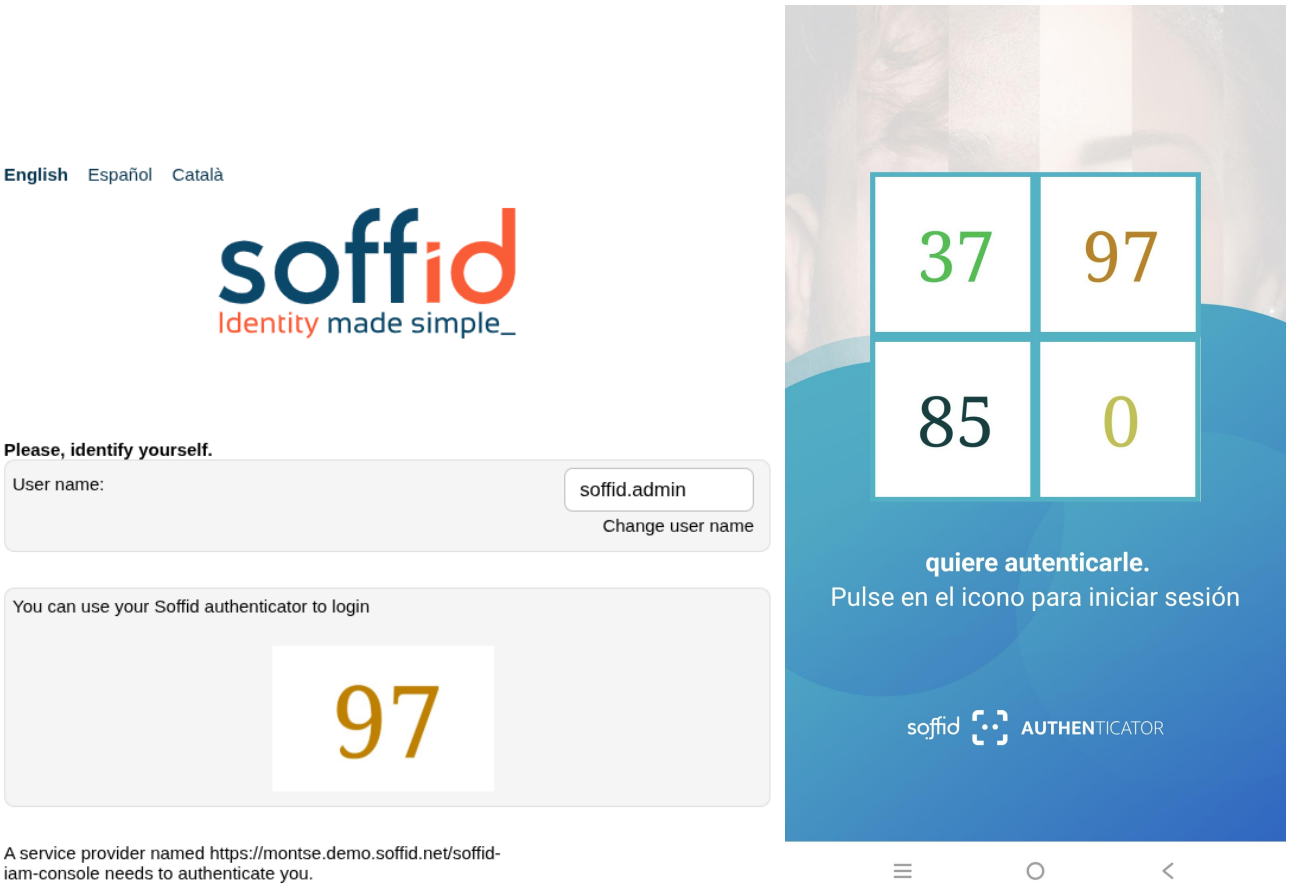

Let’s take a look at the four examples of logins!

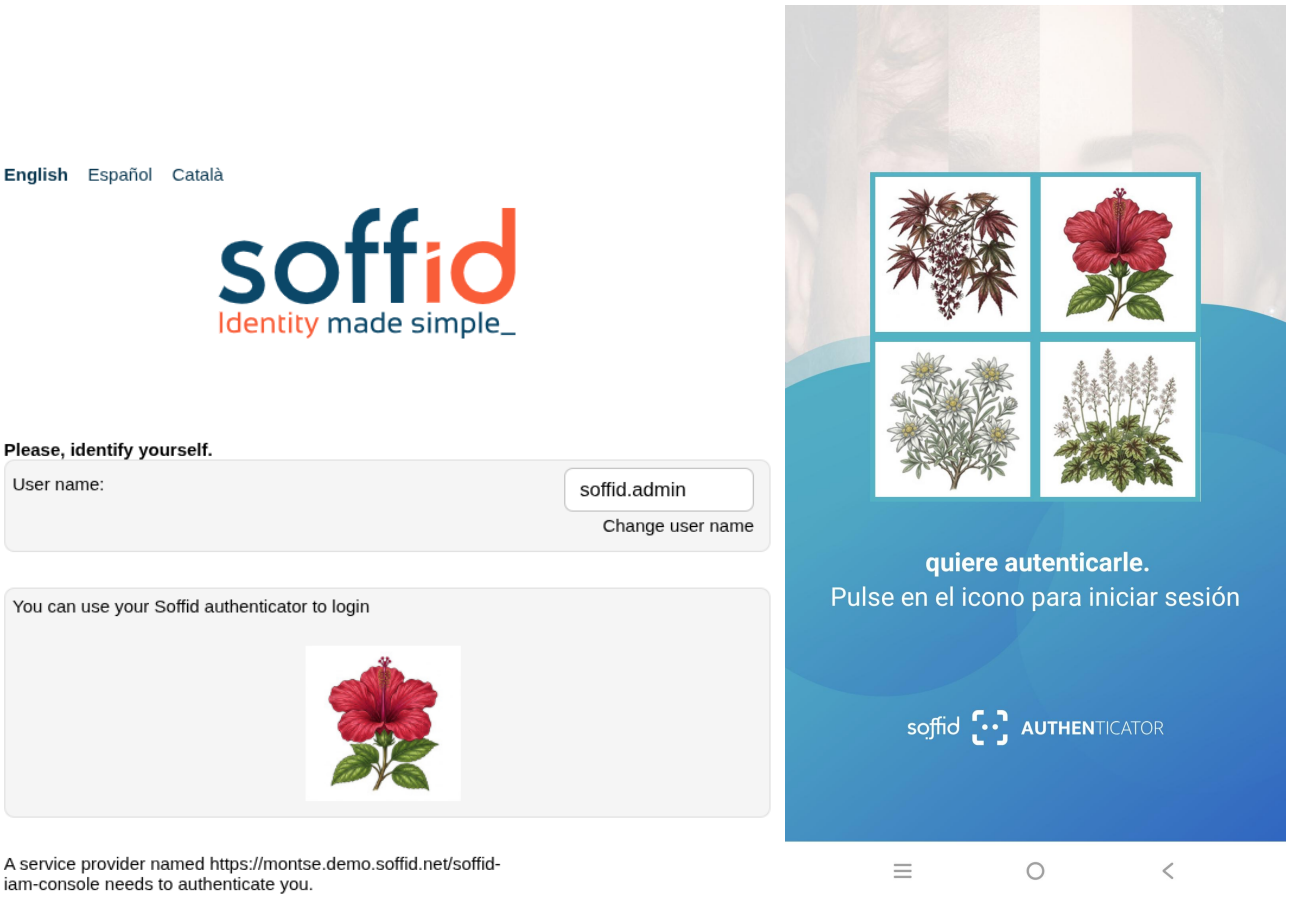

No soffid.push.images parameter or soffid.push.images=

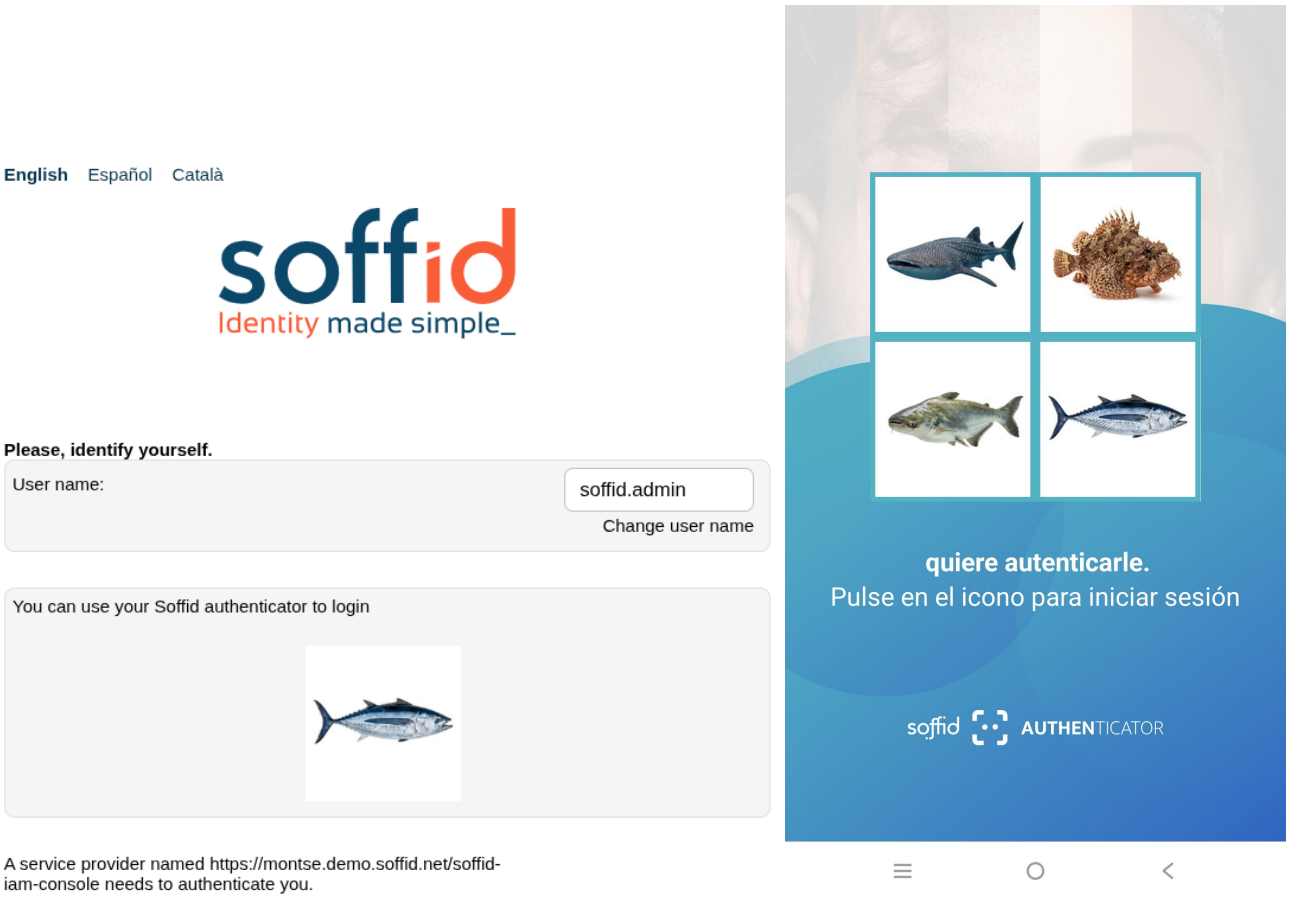

soffid.push.images=**numbers**

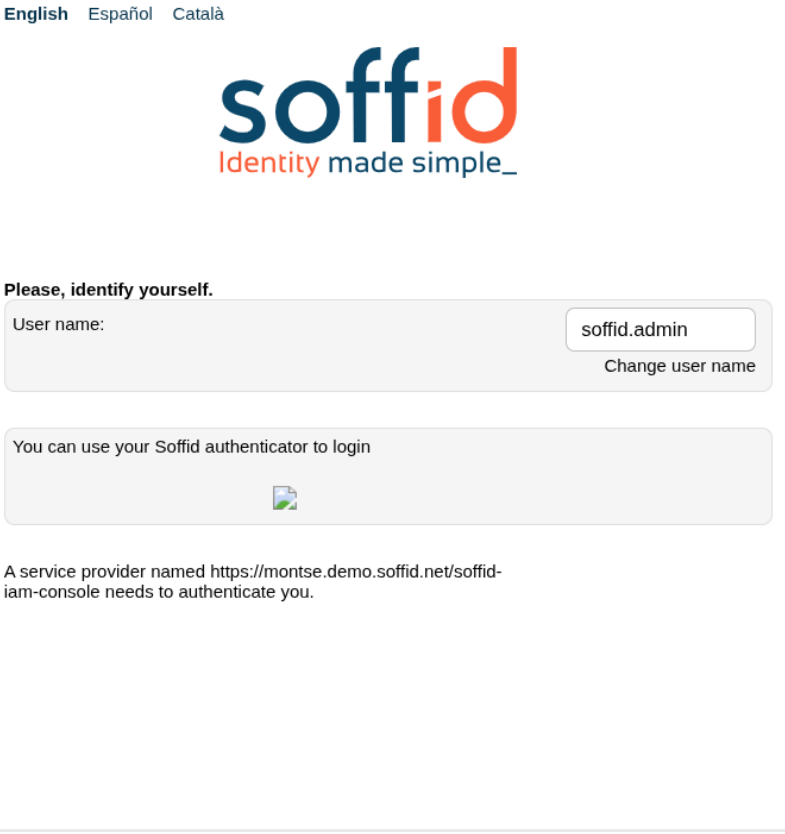

soffid.push.images=**flowers**

soffid.push.images=**fishes**

Please note that if you enter an incorrect value for the parameter, this **error** will appear.
