# 2026-07-08 New feature: geolocation service available by default

## The new feature

> From now on, the **geolocation service** and the **use of AI service** will be **enabled by default** if the AM or IRC modules have been activated. Consequently, the Network Intelligence page has been removed

## Bear in mind

Please note the following points:

- This **feature** is only **enabled** if the licence includes the **AM** or **IRC module**.
- The **geolocation service** requires that the service be available on a **public internet machine**.
- The **AI service** is available on the Soffid chat-bot page and in all script-type attributes that may appear on any page in the Console.

## How to configure it?

The following **components** must be installed:

- Console 4.0.64 (or higher)
- Syncserver 4.0.39 (or higher)
- Addon federation 4.0.36 (or higher)

Following this change, there have been further updates

- Addon admin 4.0.6 (or higher) --> to use the AI assistant correctly

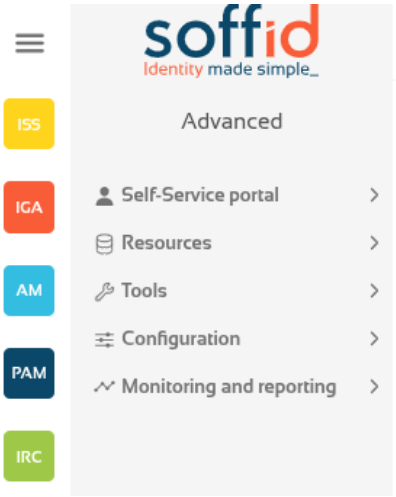

- Console 4.0.67 (or higher) --> to use the variable SOFFID_DISABLE_GEOIP to disable this service

# Let's look at an example

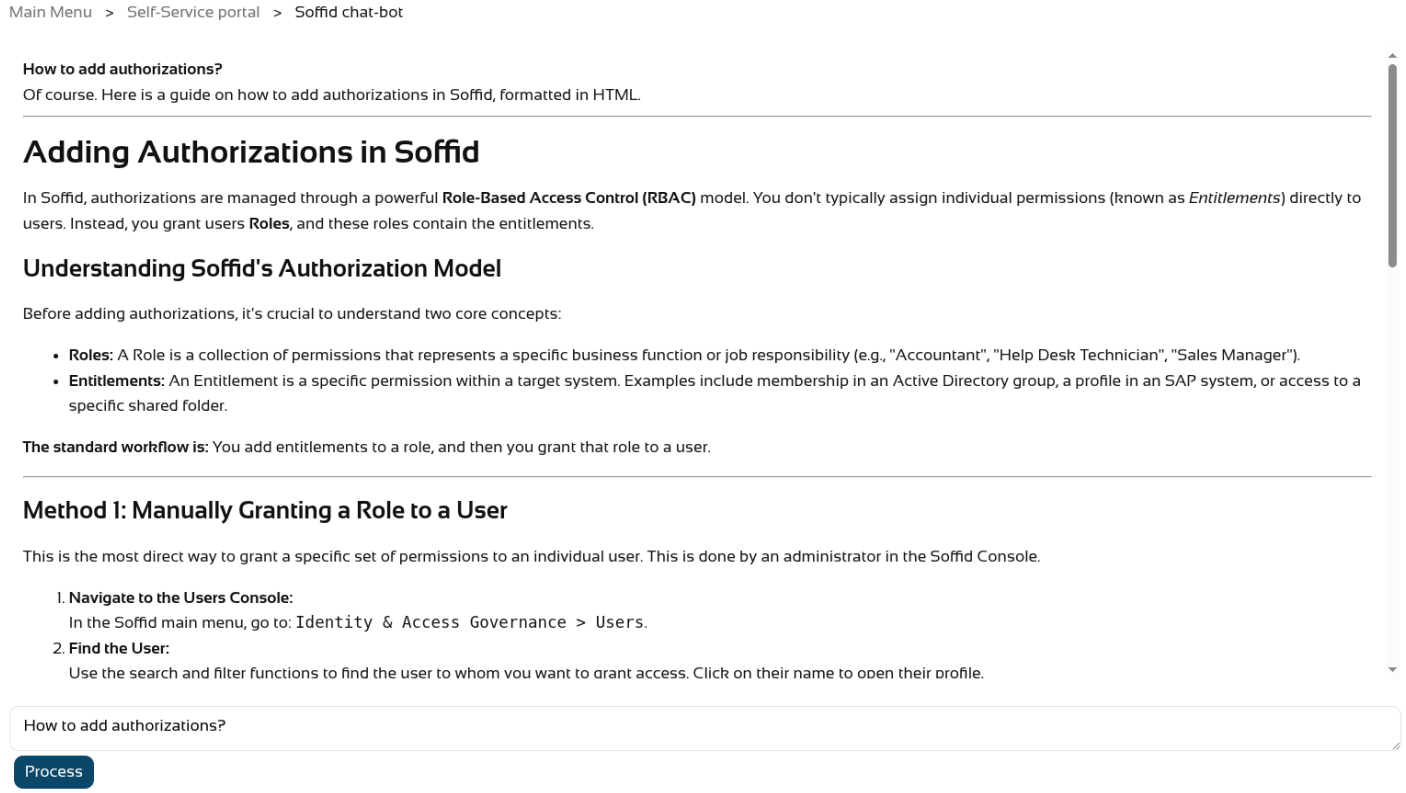

First of all, the Network Intelligence screen no longer exists.

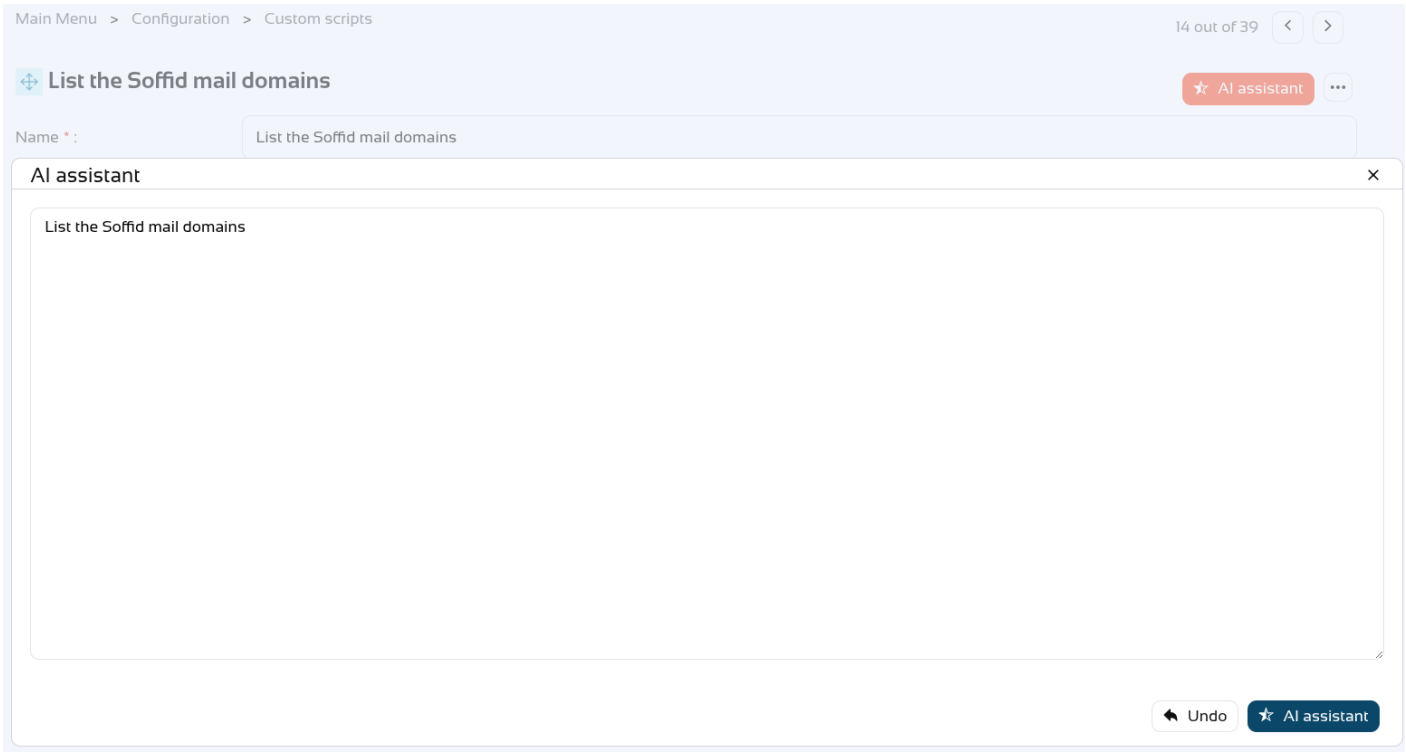

We have the necessary modules in our Soffid system.

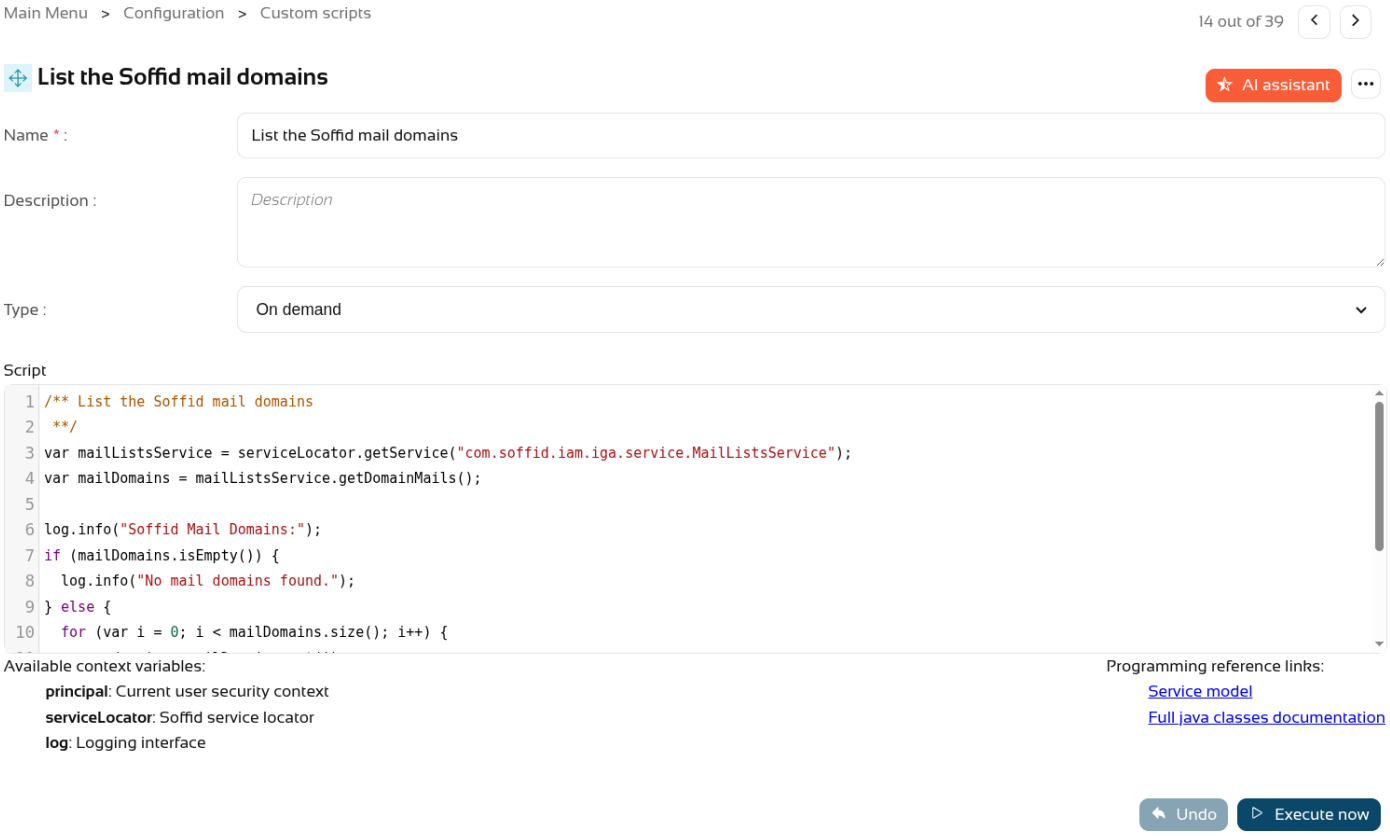

First, let’s ask the Soffid chat-bot.

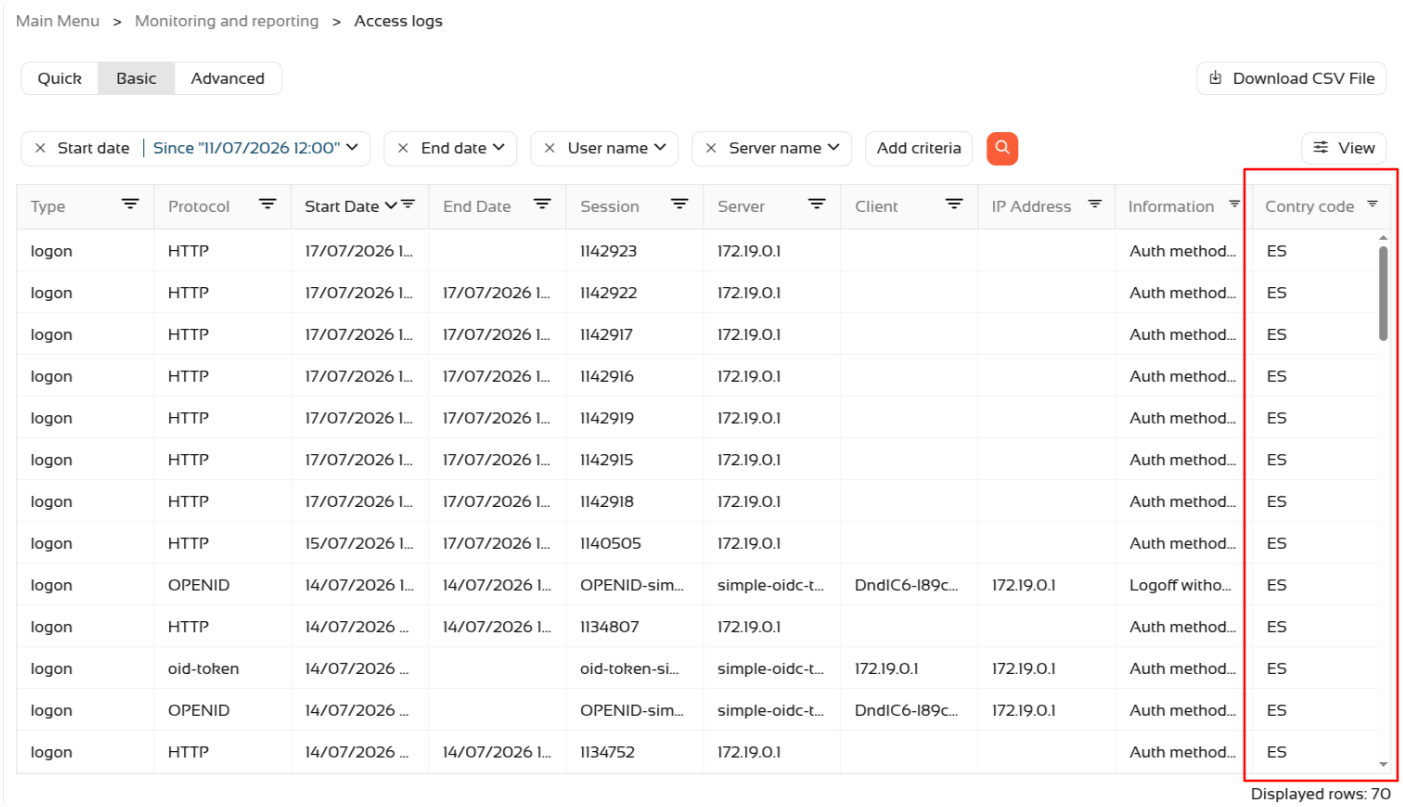

And also create a new script on the Custom scripts page.

Regarding **geolocation**, if Soffid is installed in a public location, you can check new accesses via the **Access logs** page.

- Go to **Access logs** page (in **Monitoring and reporting** folder).
- Use the **magnifying glass** button to search.
- **Sort** the list by **Start Date** in descending order.
- Click the **View** button
- Add the **Country Code** attribute.
- The country should then appear in the most **recent accesses**.
