New releases 2026 May

Welcome everyone.

We are pleased to inform you that Soffid **new releases** are now available and we have updated our download page with new versions of the Soffid components.

Please note that in **Soffid 4**, you will only find the **Console** and **Syncserver** on our enterprise download page. Starting with this version 4, **Addons** and **Connectors** must be downloaded directly from the internal **marketplace** on the Licence and plugins page. For more information, please consult our online documentation.

Below is the list of the components and changes made since the previous version was published.

Soffid 4

Console 4.0.58 (from 54)

tick Searches were not working on the custom object pages, nor via the SCIM web service.
tick The database update service from version 3 to version 4 was not working for the SQL Server database.
tick The database update service from version 3 to version 4 failed when an agent did not have the Usage attribute defined.
tick When the Console was configured as the service provider for Soffid’s identity provider, it generated unused SAML paths in the metadata.xml file.
tick One of the indexes in the account table had an incorrect name (it was not being applied).
tick Some indexes in the database were not being created because their names exceeded the permitted length.

tick **Users of the SCIM web service must now have the new “webservice:user” authorisation.** New feature

tick An error that had already been handled in the code, indicating that a host searched for by IP address could not be found, has been ignored in the log.

tick Users who do not have the SOFFID_ADMIN role will no longer see the details of errors in the Console; instead, an identifier will be displayed so that administrators can look it up in the log. New feature

tick The SCIM web service was displaying folders to which the SCIM user did not have access.

tick New headers have been added to improve the security of web requests.

tick The console log has been shortened when the syncserver is not active.

Syncserver 4.0.35 (from 34)

tick New feature to clear the account password when the account is disabled and set the last password when the account is enabled again. New feature

Federation addon 4.0.29 (from 24)

tick New feature to set a custom list of holder groups for each service provider. New feature

tick When a user attempted to log in via ESSO and the login failed, if the “esso-failed-login” issue type was enabled, the issue would not be created and would not be logged.

tick **In the Identity Provider configuration, in the attribute “TLS PublicKey”, the “Upload PKCS12 file” button did not move forward to the PIN step.**

tick The PAM session would not start if the account belonged to the identity provider

tick Hide certain OIDC attributes in an OpenID POST response, as they were not part of the standard.

tick When a user was created in Soffid via self-provisioning by the Identity Provider, an error was thrown if the user had no additional attributes.

tick When a user connected to the Identity Provider via ESSO, if the machine had an IP address that could not be resolved by the DNS resolver, an error occurred.

tick For users who use ESSO and permission elevation, shared accounts are now cached on the Windows machine to speed up access and prevent service disruption when there is no internet connection.

tick The Kerberos login has been modified because it sometimes fails.

tick The service providers' impersonation functionality failed because a library update was missing.

tick New headers have been added to improve the security of web requests.

LDAP plugin 4.0.5 (from 4)

tick A maximum number of results has been added (it is a very high value).
