

# Mail Domains

## Description

The mail domains identify each single mail domain that is going to be managed and used in Soffid.

Mail domains are validated when you enter an email in the attributes of type email.

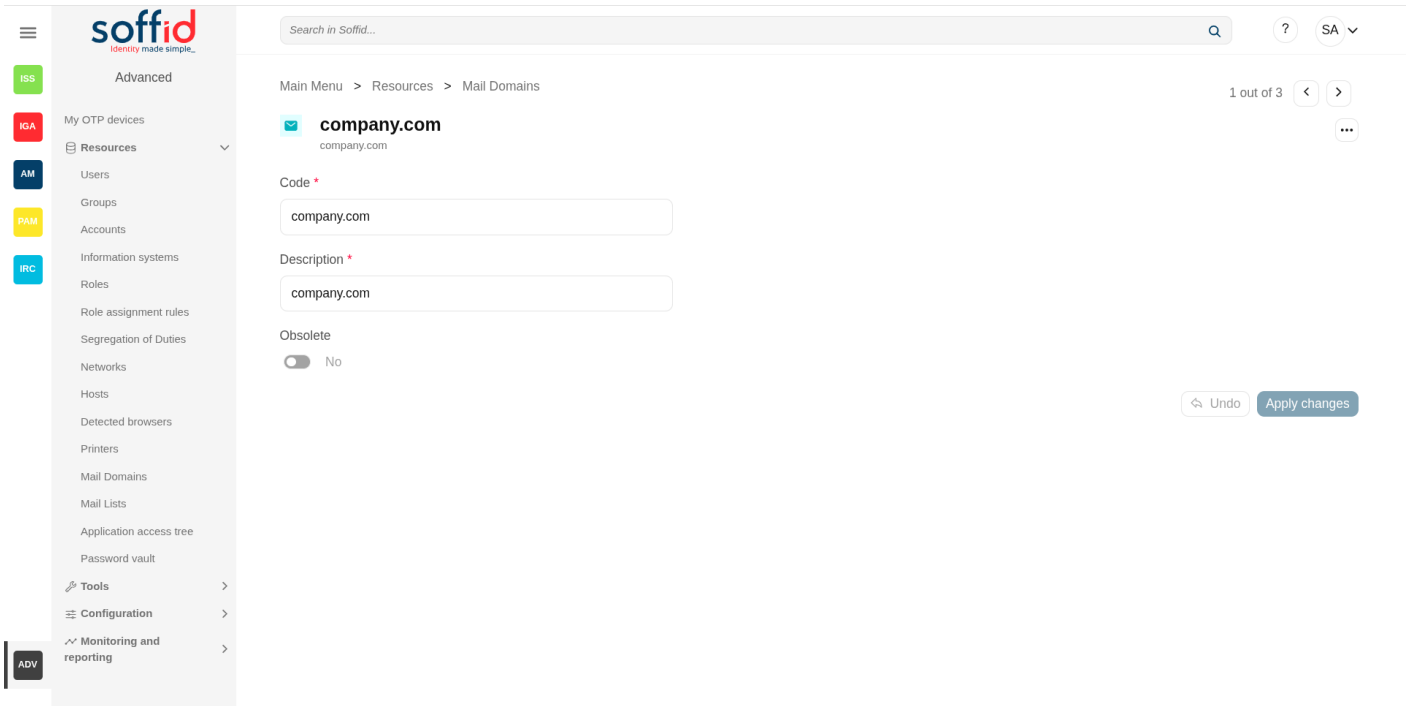

You cannot use mail domains that have not been previously registered.

If a mail domain is marked as obsolete, it won't be assigned to a user anymore.

## Screen overview

The screenshot shows the Soffid user interface for managing Mail Domains. On the left is a navigation sidebar with the Soffid logo and various menu items. The main content area displays a table of registered mail domains. The table has columns for Code, Description, and Obsolete. Three domains are listed: company.com, partner.com, and soffid.com, all with 'No' in the Obsolete column. Above the table are search filters for 'description' and 'obsolete', and buttons for 'Add new', 'Download CSV File', and 'Import'. The bottom right corner indicates 'Displayed rows: 3'.

Code	Description	Obsolete
company.com	company.com	No
partner.com	partner.com	No
soffid.com	soffid.com	No

## Related objects

- Users : email type attributes
- Mail lists : email type attributes

## Standard attributes

- **Code**: domain, it will be as in email address is written.
- **Description**: a brief description about domain name usage.
- **Obsolete**: enabled to indicate that the domain will not be used and therefore should not be assigned.

## Actions

### Mail domains table

<b>Add new</b>	Allows you to create a new mail domain. To add a new mail domain it will be mandatory to fill in the required fields
----------------	---

<b>Delete mail domain</b>	<p>Allows you to remove one or more mail domains by selecting one or more records and next clicking this button.</p> <p>To perform that action, Soffid will ask you for confirmation, you could confirm or cancel the operation.</p>
<b>Download CSV file</b>	<p>Allows you to download a CSV file with the mail domains information.</p>
<b>Import</b>	<p>Allows you to upload a CSV file with the mail domain list to add or update mail domains to Soffid.</p> <p>First, you need to pick up a CSV file, that CSV has to contain a specific configuration. Then you need to check the content to be loaded, it is allowed to choose if you want or not to load a specific attribute. And finally, you need to select the mappings for each column of the CSV file to import the data correctly and to click the Import button.</p>
<b>View</b>	<p>Allows you to add or remove columns to the table.</p> <p>It is also possible to change the order of the columns.</p>

## Mail domain detail

<b>Delete mail domain</b>	<p>Allows you to delete the mail domain.</p> <p>To delete a mail domain can click on the three points icon and then click the delete button (trash icon).</p> <p>Soffid will ask you for confirmation to perform that action, you could confirm or cancel the operation.</p>
<b>Undo</b>	<p>Allows you to undo the changes made.</p>
<b>Apply changes</b>	<p>Allows you to save the data of a new mail domain or to update the data of a specific mail domain. To save the data it will be mandatory to fill in the required fields.</p>
