
Addon upgrades

Soffid addons should be able to manage data schema changes. Soffid gives addons a standard procedure to perform data and schema upgrades. The data upgrade process is performed in three steps:

- 1.** The addons to upgrade are deployed into the soffid console using the [Plugins screen](#).
- 2.** On console boot, the data schema is updated. To perform the schema update, a Soffid developed schema updater is used. This schema updater will read the core-ddl.xml and any plugin-ddl.xml file to upgrade at once the core Soffid database objects as well as any addon database object. (See [Data schema descriptor](#))
- 3** The application bootstrap process is executed. At this step, any spring bean implementing ApplicationBootService will be invoked. This bean is responsible for completing data upgrade. Addons can also define a bean implementing ApplicationBootService for this purpose.
